Spraying is no longer an experiment; it is an accepted practice, if you desire to grow Perfect Vegetables, Fruit or Flowers. If you wish success with fruit you will have to spray your trees. It is impossible to raise fruit successfully without spraying. Spray, not sprinkle, until the solution begins to drip from the leaf.

WHEN TO SPRAY.—The time of making the application varies with the season. As a rule, for garden fruits, when the insects first appear; for orchard fruits, or the more common insects, just before the fruit buds open, and just after the blossoms fall. Never spray a tree when in blossom.

With the special pumps and prepared insecticides now on the market, the labor of successfully combating with nearly all injurious insects is very easy. We carry in stock the very best and most complete line of insecticides, also, fungicides, spray pumps, hose and nozzles.
